Quantum chaos meets quantum channels

September 24, 2024

4 1 José Alfredo

5 1.1 Model

⁶ The spin chain we are interested in studying first is that studied by Mirkin and Wisniacki in Ref. [1]:

$$H = \sum_{i=1}^{L} (h_x \sigma_i^x + h_z \sigma_i^z) - \sum_{i=1}^{L-1} J_z \sigma_i^z \sigma_{i+1}^z.$$
 eq:H:wisniacki:ising:chain

8 1.2 Mean level spacing ratio

 $_{9}$ The level spacing ratio \tilde{r}_{n} is defined as:

$$\tilde{r}_n = \frac{\min(s_n, s_{n-1})}{\max(s_n, s_{n-1})},$$
eq:level:spacing:ratio
(2)

where $s_n = E_{n+1} - E_n$. The mean level spacing ratio $\langle \tilde{r}_n \rangle$ is known to attain the value $\langle \tilde{r}_n \rangle \approx 0.5207$ when the level spacing distribution P(s) is Wigner-Dyson and $\langle \tilde{r}_n \rangle \approx 0.386$ when it is Poisson.

13 1.3 Spectral form factor

15

The spectral form factor K(t) is defined as:

$$K(t) = \frac{1}{2^L} \left\langle \left| \text{Tr} \, U(t) \right|^2 \right\rangle = \frac{1}{2^L} \left\langle \sum_{i,j} e^{i(E_i - E_j)t} \right\rangle,\tag{3}$$

where $\langle \cdot \rangle$ denotes the ensemble-average over statistically-similar systems.

17 1.4 Chaometer's quantum channel

18 The reduced dyanmics of the chaometer is described by the quantum channel:

$$\mathcal{E}(\rho) = \operatorname{Tr}_{E}\left(e^{-iHt}\rho \otimes \left|\psi_{0}^{(E)}\right\rangle \left\langle \psi_{0}^{(E)}\right| e^{iHt}\right),$$
 eq:chaometer:channel

where H is that of eq. (1), $|\psi_0^{(E)}\rangle$ the initial state of all spins except the chaometer, and ρ the initial state of the chaometer.

- The chaometer's quantum channel \mathcal{E} , in general, is divisible into:
- 23 1. A unitary operation rotating the Bloch's sphere.
- 2. A quantum channel that deforms the Bloch's sphere and translates its origin.
- 25 Both operations do not commute.

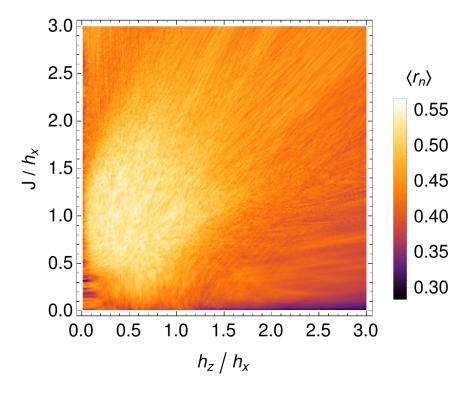

Figure 1: Mean level spacing ratio $\langle \tilde{r}_n \rangle$ [c.f. eq. (2)] of the Ising chain with Hamiltonian (1) as a function of ratios h_z/h_x and J/h_x . We assume $J_z = J \, \forall \, k$.

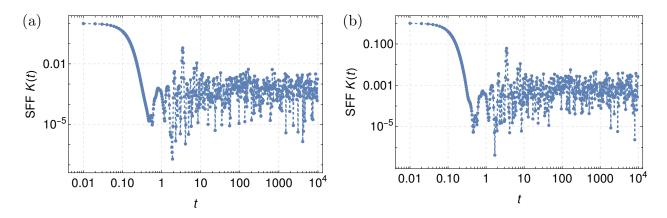

Figure 2: Spectral form factor (SFF) [c.f. (3)] in regular region: $h_z/h_x = 2.5$ and $J/h_x = 1$. (a) Whole spectrum. (b) Even-parity subspace spectrum.

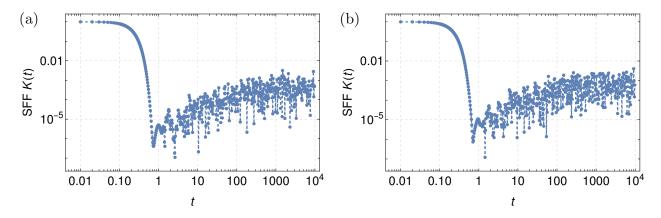

Figure 3: Spectral form factor (SFF) [c.f. (3)] in chaotic region: $h_z/h_x = 0.5$ and $J/h_x = 1$. (a) Whole spectrum. (b) Even-parity subspace spectrum. fig:sff:chaotic

Purity of the chaometer ₂₆ 1.5

27 Averaged purity \mathcal{P} is defined in Ref. [1] as:

$$\overline{\mathcal{P}} = \frac{1}{N} \sum_{i=1}^{N} \left(\frac{1}{T} \int_{0}^{T} \text{Tr} \left[\rho_{i}^{2}(t) \right] \right)$$
 eq:avg:purity (5)

where: 29

28

31

32

34

35

• $\rho_i(t)$: chaometer's density matrix.

• N: number of different random initial states of the whole chain. N = 50 in Mirkin and Wisniacki [1].

• T: maximum time. T = 50 in Mirkin and Wisniacki [1].

Also, the normalized averaged purity is defined as

$$\overline{P}_{Norm} = \frac{\overline{P} - \min(\overline{P})}{\max(\overline{P}) - \min(\overline{P})},$$
 eq:avg:norm:purity (6)

where $\max(\overline{P})$ and $\min(\overline{P})$ are the minimum and maximum value obtained when sweeping the parameter range (h_z in their case).

In Fig. 4 we plot one realization of the dynamics of purity of the chaometer. We compare in Fig. 5 our results and those of Mirkin and Wisniacki [1].

Purity of Choi-Jamiołkowski matrix 40 1.6

We investigate the purity of Choi-Jamiołkowski matrix of quantum channel $\mathcal{E}(t)$ of the chaometer [c.f. eq. (4)]

To compute the Choi-Jamiołkowski matrix $\mathcal{D}(t)$ of the chaometer's quantum channel in eq. (4) we use the definition $(\mathcal{E} \otimes 1)[|\phi^+\rangle\langle\phi^+|]$, with $|\phi^+\rangle = 1/\sqrt{2}(|0,0\rangle + |1,1\rangle)$ is the maximally entangled state between two spins, and obtain

> eq:choi:chaometer (7)

$$\mathcal{D}(t) = \frac{1}{2} \sum_{i,j,p,q} \langle j, \psi_{0E} | U^{\dagger}(t) (|p\rangle\langle q| \otimes \mathbb{1}_{E}) U(t) | i, \psi_{0E} \rangle |q, i\rangle\langle p, j|.$$
 (7)

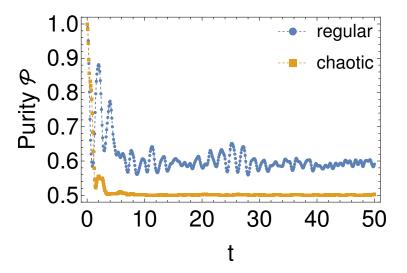

Figure 4: Dynamics of chaometer's purity of a single realization with the same initial state of the environment of the first chaometer's quantum channel of the videos.

fig:purity:one:realization

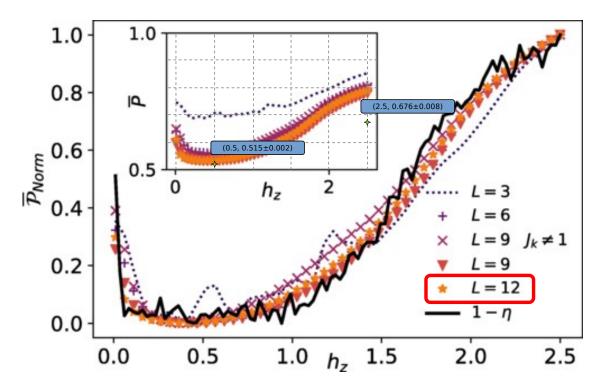

Figure 5: Averaged \overline{P} and averaged normalized purities \overline{P}_{Norm} [c.f. eqs. (5) and (6).] for N=50 random initial states of the chaometer for each quantum channel showed in the videos. JA: Tendría más sentido sacar la pureza del canal. Lo pienso Taken and modified from Ref. [1].

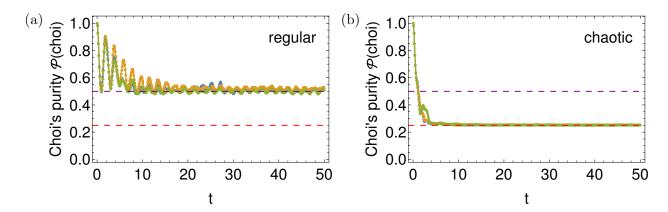

Figure 6: Purity of Choi-Jamiołkowski matrix in (a) regular $(h_z = 2.5)$ and (b) chaotic $(h_z = 0.5)$ for the three random initial states showed in the video.

Let us write $\mathcal{E}(\rho)$ in computational basis. From eq. (4) we write

47

48

57

59

$$\mathcal{E}(\rho) = \sum_{k,l} e^{-i(E_k - E_l)t} \langle E_k | (\rho \otimes |\psi_E \rangle \langle \psi_E |) | E_l \rangle \operatorname{Tr}_E (|E_k \rangle \langle E_l |)$$
(8)

$$= \sum_{k,l,p,p',\vec{q},\vec{q}'} e^{-i(E_k - E_l)t} \langle E_k | (\rho \otimes |\psi_E \rangle \langle \psi_E |) | E_l \rangle \operatorname{Tr}_E (|p,\vec{q}\rangle \langle p,\vec{q}|E_k) \langle E_l | p',\vec{q}'\rangle \langle p',\vec{q}' |), \tag{9}$$

where \vec{q} and \vec{q}' are indices of elements of the basis of the environment,

$$= \sum_{p,p',\vec{q}} \langle p, \vec{q} | U(t)(\rho \otimes |\psi_E\rangle \langle \psi_E|) U^{\dagger}(t) | p', \vec{q} \rangle | p \rangle \langle p'|$$

$$= \sum_{p,p'} \langle p | \operatorname{Tr}_E[U(t)(\rho \otimes |\psi_E\rangle \langle \psi_E|) U^{\dagger}(t)] | p' \rangle | p \rangle \langle p'|.$$
(10)
eq:chaometer:channel:2

(11)

To compute the Choi-Jamiołkowski matrix $\mathcal{D}(t)$ of the chaometer's quantum channel in eq. (4) we use the definition $(\mathcal{E} \otimes 1)[|\phi^+\rangle\langle\phi^+|]$, with $|\phi^+\rangle = 1/\sqrt{2}(|0,0\rangle + |1,1\rangle)$ is the maximally entangled state between two spins, and eq. (11) to obtain

$$\mathcal{D}(t) = \frac{1}{2} \sum_{i,j,p,p',\vec{q}} \langle p, \vec{q} | U(t)(|i,\psi_E\rangle\langle j,\psi_E|)U^{\dagger}(t) | p', \vec{q} \rangle | p, i \rangle\langle p', j|$$

$$= \frac{1}{2} \sum_{i,j,p,p',\vec{q}} \langle p, \vec{q} | U(t)(|i,\psi_E\rangle\langle j,\psi_E|)U^{\dagger}(t) | p', \vec{q} \rangle | p, i \rangle\langle p', j|$$

$$= \frac{1}{2} \sum_{i,j,p,p',\vec{q}} \langle p, \vec{q} | U(t)(|i,\psi_E\rangle\langle j,\psi_E|)U^{\dagger}(t) | p', \vec{q} \rangle | p, i \rangle\langle p', j|$$

$$= \frac{1}{2} \sum_{i,j,p,p',\vec{q}} \langle p, \vec{q} | U(t)(|i,\psi_E\rangle\langle j,\psi_E|)U^{\dagger}(t) | p', \vec{q} \rangle | p, i \rangle\langle p', j|$$

$$= \frac{1}{2} \sum_{i,j,p,p',\vec{q}} \langle p, \vec{q} | U(t)(|i,\psi_E\rangle\langle j,\psi_E|)U^{\dagger}(t) | p', \vec{q} \rangle | p, i \rangle\langle p', j|$$

$$= \frac{1}{2} \sum_{i,j,p,p',\vec{q}} \langle p, \vec{q} | U(t)(|i,\psi_E\rangle\langle j,\psi_E|)U^{\dagger}(t) | p', \vec{q} \rangle | p, i \rangle\langle p', j|$$

$$= \frac{1}{2} \sum_{i,j,p,p',\vec{q}} \langle p, \vec{q} | U(t)(|i,\psi_E\rangle\langle j,\psi_E|)U^{\dagger}(t) | p', \vec{q} \rangle | p, i \rangle\langle p', j|$$

$$= \frac{1}{2} \sum_{i,j,p,p',\vec{q}} \langle p, \vec{q} | U(t)(|i,\psi_E\rangle\langle j,\psi_E|)U^{\dagger}(t) | p', \vec{q} \rangle | p, i \rangle\langle p', j|$$

$$= \frac{1}{2} \sum_{i,j,p,p',\vec{q}} \langle p, \vec{q} | U(t)(|i,\psi_E\rangle\langle j,\psi_E|)U^{\dagger}(t) | p', \vec{q} \rangle | p, i \rangle\langle p', j|$$

$$= \frac{1}{2} \sum_{i,j,p,p',\vec{q}} \langle p, \vec{q} | U(t)(|i,\psi_E\rangle\langle j,\psi_E|)U^{\dagger}(t) | p', \vec{q} \rangle | p, i \rangle\langle p', j| p, j \rangle\langle p', j| p, j$$

$$= \frac{1}{2} \sum_{i,j,p,p'} \langle j, \psi_{0E} | U^{\dagger}(t) (|p'\rangle\langle p| \otimes \mathbb{1}_{E}) U(t) | i, \psi_{0E} \rangle |p, i\rangle\langle p', j|,$$
(13)

where we have only reordered the factors and used the resolution of identity over \mathcal{H}_E .

We compute the purity of $\mathcal{D}(t)$. From eq. (7) it is straightforward to obtain

$$\operatorname{Tr}\left[\mathcal{D}^{2}(t)\right] = \frac{1}{4} \sum_{i,j,p,q} \left| \langle i, \psi_{0E} | U^{\dagger}(t) \left(|p\rangle\langle q| \otimes \mathbb{1}_{E} \right) U(t) |j, \psi_{0E}\rangle \right|^{2}. \tag{14}$$

61 Moreover, reordering this expression an interesting interpretation of the purity of the Choi-Jamiołkowski 62 matrix is revealed. Let us conveniently rewrite eq. (14) as

⁶³ Tr[
$$\mathcal{D}^{2}(t)$$
] = $\langle \psi_{0E} | \operatorname{Tr}_{S} \{ U^{\dagger}(t) \sum_{p,q} \left[\left(\frac{|p\rangle\langle q|}{\sqrt{2}} \otimes \mathbb{1}_{E} \right) U(t) \left(\frac{\mathbb{1}_{S}}{2} \otimes |\psi_{0E}\rangle\langle \psi_{0E}| \right) U^{\dagger}(t) \left(\frac{|q\rangle\langle p|}{\sqrt{2}q: choi: chaometer: purity: 2} \right) U(t) \right\} |\psi_{0E}\rangle$. (15)

JA: esta es una especie de echo de Loschmidt!!! In other words, the purity of $\mathcal{D}(t)$ represents the probability that the environment remains in its initial state after the following process: First, the system and environment are initialized in a product state, with the system in a maximally mixed state. Next, the combined

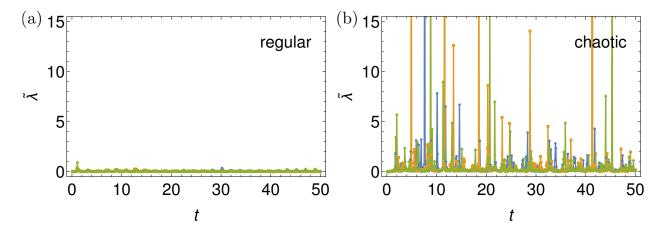

Figure 7: Most negative eigenvalue $\tilde{\lambda}$ of map $\Lambda(t,s)/2$, with s=0.1 [c.f. regs_{av}17] and (18) is "jami-"

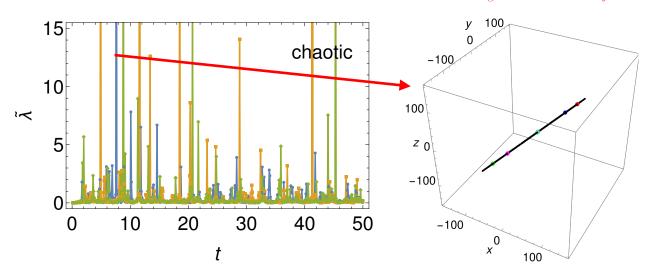

Figure 8: Burst of the Bloch sphere at t = 0.5 s.

fig:burst

eq:Lambda

67 system evolves. Then, a completely depolarizing channel is applied to the system. Finally, the system and environment undergo reverse evolution.

The Loschmidt echo is defined as

70

76

eq:loschmidt:echo $M(t) = \left| \langle \psi_0 | e^{-iH_2 t/\hbar} e^{-iH_1 t/\hbar} | \psi_0 \rangle \right|^2$ (16)

Non complete-positiveness of $\Lambda(t,s)$

Any quantum channel $\mathcal{E}(t)$ can composed as

 $\mathcal{E}(t) = \Lambda(t, s) \circ \mathcal{E}(s, 0),$

$$\mathcal{E}(t) = \Lambda(t,s) \circ \mathcal{E}(s,0), \tag{17}$$

₇₄ nonetheless, $\Lambda(t,s)$ is not in general completely positive. A way to quantify how far is $\Lambda(t,s)$ from being completely positive is through $\tilde{\lambda}$: eq:lambda:tilde

$$\tilde{\lambda} = |\min(0, \lambda_{\text{smallest}})|, \tag{18}$$

where $\lambda_{\text{smallest}}$ is the smallest eigenvalue of $\Lambda^R(t,s)/2$. We have added the factor 1/2 just so $\text{Tr}[\Lambda^R(t,s)/2] = 1$. Let us fix s=0.1 and investigate the complete positiviness of $\Lambda(t,s)$, see Fig. 7.

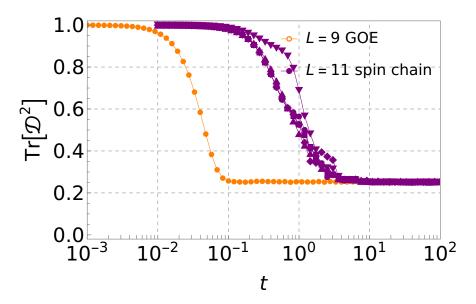

Figure 9: Purity of the Choi-Jamiołkowski matrix of chaometer's quantum channel and another channel from a Hamiltonian taken from the GOE ensemble.

fig:choi:purity:spin:chain:vs:goe

79 1.8 Purity of Choi-Jamiołkowski matrix

- 80 2 Charles
